

GREEN BUILDINGS, RISK FREE

Green buildings have become very popular over the last decade, but because of the technicalities and safety issues they haven't been executed very often. Our isolated planters provide the following advantages:

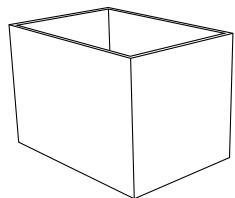

- Isolated planters prevent damage to the building's structure due to the continuous growth of roots and waterproofing failures.
- Light and sturdy design. Using UHPC and GRC reinforces the structure of our product making it long lasting and maintenance free while being only 1.5cm thick makes them light for easier installation and minimise the weight applied on the building.
- We provide our product in many textures and colours as well as many standard and custom made sizes for any aesthetic you wish.
