

GRC SHADING SCREENS

Our new modern range of Shading Screens is made of GRC (Glass Fibre Reinforced Concrete), aluminium and titanium dioxide which is proven to have self-cleaning, pollution control and photo sterilisation properties. The mechanism used is from the Finnish company Helaform and can be safely used both indoors and outdoors including Cyprus' relentless heat. GRC is an ideal material that can be shaped to the most demanding architectural requirements. It needs no maintenance while its life is estimated at 100 years.

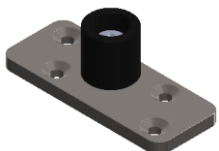

For our shading screens we use a mechanism from Finland so we can include mobility in our design. as well as a beautiful pattern it can also move to give you the flexibility to shade your space as you please.
